EDUCATION

University of Economics and Law (VNU-HCM)

Cumulative GPA: 3.0/4.0 | IELTS: 6.0

Bachelor of Financial Technology (Fintech)

Expected Graduation: August 2026

Relevant Coursework: Database, Data mining, Big Data Analytics in Finance, Blockchain Technology, Application software package for finance, Big data Business information systems, Financial Management, Financial risk management,...

Certifications & Awards

Coursera certificate: [Ask Questions to Make Data-Driven Decisions](#)

NVIDIA certificate: [Accelerating End-to-End Data Science Workflows](#)

SKILLS

- Proficient in Python, SQL, R
- Data Tools: Power BI, Excel, Jupyter Notebook, Tableau, Looker Studio

WORK EXPERIENCE AND INTERNSHIP

Maybank Investment Bank Vietnam (Phu Nhuan Branch)

Intern

06/2024 - 12/2024

- Applied Python to clean, visualize, and interpret more than 100,000 trading rows and authored daily and weekly market reports, reducing manual analysis time by about 30 percent.
- Executed financial analysis and equity valuation of listed companies, prepared investment briefs, monitored portfolios, and supported client development through prospect screening and pitch materials.
- Designed and deployed an end to end pipeline to collect, process, and produce stock ticker analysis reports, delivering daily insights and improving team responsiveness by about 25 percent.

PROJECT

Automated financial report export ([Link](#))

08/2024 - 10/2024

- Built an end to end Python pipeline with requests, pandas, python-dotenv and vnstock to crawl Vietnamese stock data, clean, validate it, normalize, impute missing values and persist schema-validated datasets in a structured repository ready for reporting.
- Automated reporting so that when a ticker is entered the system fetches processed fundamentals and metrics, visualizes with Matplotlib and Seaborn and exports a standardized PDF.
- Integrated the Gemini API to add concise insights and the latest ticker news, reducing manual preparation time by about 90 percent and improving team responsiveness by about 25 percent.

Airbnb rental pricing predictor ([Link](#))

04/2024 - 06/2024

- Cleaned and engineered an Airbnb dataset by converting currency fields to numeric, parsing dates, handling outliers at the 99.5th percentile, and creating features such as days since first hosted, bedrooms per person, and bathrooms per person.
- Built an end-to-end preprocessing and modeling pipeline using ColumnTransformer, StandardScaler, OneHotEncoder, Linear Regression, and Random Forest, with city-stratified sampling and hyperparameter tuning via GridSearchCV.
- Feature-importance analysis indicated that variables such as maximum capacity, number of bathrooms, number of bedrooms, and price are key factors influencing rental prices.

Workforce Insight Hub: Retention and Compensation ([Link](#))

08/2023 - 02/2024

- Performed end-to-end HR data preprocessing and EDA, encoding and scaling variables and using histograms, KDE, boxplots, and a correlation heatmap to identify attrition risks.
- Built attrition models with Random Forest and logistic regression, achieving 85 percent accuracy and 0.07 recall for leavers, identified key drivers including MonthlyIncome, Age, OverTime, TotalWorkingYears, and DailyRate, and visualized feature importance.
- Clustered employees using MonthlyIncome, TotalWorkingYears, YearsAtCompany, and JobSatisfaction, then compared job satisfaction across clusters to recommend salary and overtime policies.
